CPS-EP2000(R2) MANUAL

CPS-EP2000 2000W Power Supply scalable

19“ embedded 2U/3U or hardmount in all positions, PFC 0,99

Features:

- Optional LAN interface plug & play
- 3D Heat Dissipation
- CSB Current Share Bus paralleling 7 units
- Inhibit for safe interlocking
- Remote Shutdown
- Sense mode
- Current Monitoring 0-5V
- Power Good Relay DC-ok
- Precise dynamics on load change
- Series & parallel operation up to 100kW
- EMC conducted class B, radiated class A
- Efficiency 92-94%
- PFC Powerfactor 0,99
- Variable controlled fans from Papst
- Long lifetime under hard operation
- Solid 2U and 3U subframes available

Model	Voltage	Voltage setting	Current
CPS-EP2000.024	**24Vdc**	**24 – 30Vdc**	**84A**
CPS-EP2000.036	**36Vdc**	**30 – 45Vdc**	**56A**
CPS-EP2000.048	**48Vdc**	**45 – 58Vdc**	**42A**
CPS-EP2000.072	**72Vdc**	**58 – 90Vdc**	**28A**
CPS-EP2000.110	**110Vdc**	**90 – 150Vdc**	**18,2A**

Technical description - a unique mechanical concept

The Camtec CPS-EP models are high-precision industrial power supplies „Made in Germany“. These power supplies are designed for scalable power systems.

For more than 25 years the Camtec Power Supplies manufactures high-end switch mode power supplies in Germany. A field breakdown of below 0,004% over a 10-year period under review approves our ambitious quality concept. Each manufactured Camtec product passes several 100% random tests for each detailed function and a full-load Burn-In test.

Although it is not required from the safety norms our production applies a routine safety test to each manufactured device, even if it is an extra low-voltage model. The components in the assembled device pass stress aging to achieve an even level and to prevent from delayed failures. Our internal product engineering guidelines provide a clear target: Camtec product reputation must say „mount and forget“. Quality is never a mere promise for our team.

The CPS-EP is the value product that 100% basis on the CPS-EX series. The CPS-EP power supplies provide low noise & ripple and a precise setting at high load changes. With an efficiency of 92-94% and a power factor of 0.99, the devices are highly energy efficient.

Equipped with high-end capacitors of outstanding lifetime our power supplies guarantee a very long and reliable operation time. The circuit design of the CPS-EP Series allows cope playing with complex loads. The internal protection circuits protect the power supply and the connected system, even in exceptional situations. The CPS-EP series is protected from high transients by strong filters with high energy efficiency. All inputs and outputs and the interface are electrically isolated. The design specifications call for the highest standards of safety and interference suppression. The device was developed in accordance with the requirements of EN61010-1, EN61010-2-201, EN62368-1 and the EMC standards EN55032 conducted Class B, radiated Class A.

The mechanical design of the CPS-EP2000 device series is unique. It is the first power supply line in the world market, which can be flexibly adapted to any installation situation.
The forced air-cooling system with monitored and load-dependent variable fan control, allows a detached position in the system. By simple and cost-effective wall brackets the device can be integrated in any position in 90° increments. Unlike comparable power supplies Camtec comes here for the first time to let the system integrator completely free hand. The cooling concepts for supply and exhaust air can be designed to completely remove the heat dissipation from the cabinet. Complex and expensive air-conditionings for switch cabinets can be reduced to a minimum or even eliminate. Brackets for air channels are available as an option. In selecting the fan, as with all our power supplies, in our opinion we use with the German manufacturer EBM Papst the highest quality and most reliable devices in the world market.

The installation of the power supply in a 19" subrack is guaranteed in the simplest way. Again, our engineers have decided to offer a completely open and flexible system. The optional front panels allow the power supplies the use in either a 2U or 3U subrack. In this way we can realized 6kW in 2U-rack and up to 10kW in a 3U-rack with the CPS-EP2000 models. With Zero-Stacking the series allows scalable high-power DC source in a comparable small 19-inch rack unit. For power applications with high dynamic range above 10kW we recommend contacting our support team.

As accessories for the CPS-EP Camtec provides matched 19 "subframes. Our subracks deserve the name of a carrier, because they really are extremely stable made of stainless steel. The power supplies have nickel-plated steel pins to position the power supplies in the subframes. The so married together systems withstand the toughest conditions. All mechanical connections in the power supplies or on the racks are constructed with A2 or nickel-plated screws, so that they provide maximum protection against corrosion and conductivity.

The optional DIGI3201 LAN interface can be exchanged in the field by the customer. The idea is to allow easy system upgrades from analogue to digital controls via plug & play configuration by the customer. Just fit the interface and it automatically calibrates to the power supply unit. Set an IP-address, define as the master or a slave and give it a name and you are done. This keeps service cost down and makes the power supply scalable to reuse in different system architecture.

(Subject to alterations. This product is not designed to be used in applications such as life support systems wherein a failure or malfunction could result in injury or death)

CAMTEC POWER SUPPLIES

CPS-EP2000(R2) MANUAL

Features

Idling behavior
The CPS-EP Series is permanently open-circuit proof. When an output voltage is preset it comes stable. If a load is switched suddenly, the unit stabilized within <1ms. An overshoot of the output voltage is irrelevant.

Start behavior
The power supply has a start delay of 1s to stabilize all measuring circuits for the interface messages accurately. The power supply starts with a ramp (soft start) of 100ms. The output voltage does not overshoot - regardless of whether a load is connected or not.

Galvanic isolation and insulation
The switching power supply is galvanically isolated between the input and the output. All major digital inputs and outputs of the interface are electrically isolated.

Voltage set (Uadj)
The output voltage of the CPS-EP power supply can be adjusted by a potentiometer located at the rear of the unit. The current limit is fix. The power supply operates data stable even at all output voltages.

C Monitor (Imon)
The power supply provides real-time monitoring of the output current. It is the exact and real value at the output terminals. The latency signal preset to the measured value is negligible since the control circuit is constructed completely analogously.

Potentiometer Internal Control (Uadj)
The power supply will be set with an internal potentiometer. It is located at the rear of the unit.

Sense Mode
The power supply has a sense mode to compensate for voltage drops of 2V per load line.

Continuous Mode
The unit operates in continuous mode. In the continuous mode, the power supply provides constant current mode in a continuous flow and no ticker-operation.

Current Share Bus (CS)
In parallel operation, the involved network components communicate with each other and share the total power evenly to each other.

Remote Shutdown (SD)
All CPS-EP devices have a remote shutdown (open collector or switching contacts).

Inhibit Mode (Interlock)
The inhibit circuit reliably prevents unintentional starting of the power supply. The control loop is internally locked. Since this blocking is done progressively it is active even when the control signal, is missing due to a cable break or temporarily suspend. A premature restart of the power supply is prevented.
The inhibit input can be connected to a relay or switch. If the contact is interrupted, the power supply is switched off. If the contact is closed again, the power supply restarts.

DC and AC Fail
By DC-fail the power supply reports that the power output is disabled.
By AC-fail the power supply reports an AC undervoltage. Both signals have separate outputs. Each of them can be selected between NO and NC.

Over Voltage Protection (OVP)
Until the abolition of the fault the device switches off.

Over Current Protection (OCP)
The power supply provides continous current when it is overloaded. The voltage goes down to zero voltage.

Temperature Thermal Shutdown (OT)
The device has a thermal monitoring. When the temperature of the power supply is higher than the over temperature protection threshold, the unit shuts down and automatically restarts. An alarm signal is applied to the interface.

Fan Failure Monitoring (FF)
If it comes to a fan failure or blocking, a signal is applied to the interface. The speed signal of the fan is monitored. Thus, even a creeping fault is detected at an early stage and there is a warning long sold separately in front of a fan failure.

LAN Interface 12bit isolated (DIGI3201)
The standard equipment of the power supply is an analogue interface.
Optionally, the unit can be equipped with a digital interface on request. The interface is being configured with a standard WEB-Browser.

3D-HD (3D Heat Dissipation)
Our aligned and controlled heat dissipation design opens possibilities that are formerly being reserved to custom design power supplies: Steplessly hard mount of the CPS-EP2000/3000 power supply modules in a 3D-room.
In practice that means that one can mount the modules into every angle imaginable. Our 3D heat dissipation (3D-HD) ensures optimal cooling in each mounting position you may consider.

Design-to-Service:
Most recorded failures in the field concern the signal interface of a power supply. Camtec offers new concept of design-to-service that allows the customer easily to exchange the interface himself in the field. The analogue and digital interfaces apply plug & play self calibrating and can be used independent from the model CPS-i/EX/EP 2000 & 3000 Thus, system down cost is being reduced and only a small amount of spare parts need to be stocked by the customer.

(Subject to alterations. This product is not designed to be used in applications such as life support systems wherein a failure or malfunction could result in injury or death)

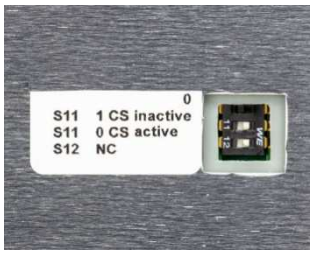
(1) Not available for EP-series

Configuration of the Current Share Bus (CS)

Mode	S11	S12
CS active	0	
CS non-active	1	

Warning! CS (Current Share Mode) only applies when a current distribution must take place while parallel operation mode. In single or parallel operation without the need of CS, always switch CS with S11 to OFF=1.
Factory set: CS non-active (S11=1)



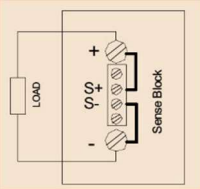
Compensation of Load Line Drop Voltage (Sense ++/--), standard operation mode

The CPS-EP power supply has a Sense Mode to compensate for the voltage drop over long load lines. The compensation amounts to a maximum of 2V per load line. Under certain circumstances, it can be expected to apply more complicated external interference suppression. If sense is not used, CON4 Sense +/+ and Sense -/- shall necessarily be connected by short bridges to the power outputs (factory setup).

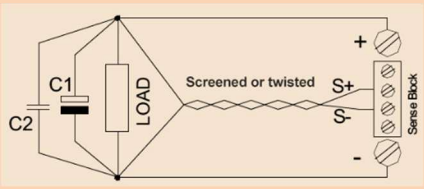
Sense operation: Remove the bridges between Sense +/+, Sense -/- and the power outputs. Connect the sense lines directly to the load. It is irrelevant which of the local connections Sense +/+ and Sense -/- are applied. Pay attention to the polarity of plus and minus of the load to prevent damage to the power supply. To avoid interference, twist the sense lines. To reduce inductive effects, we recommend that the load lines position is close to each other. To supply a pulsating load, the use of an electrolytic capacitor and a cermic capacitor has proved. The internal Over Voltage Protection (OVP) of the power supply controls the DC power directly to the DC output terminals. In case of an error the OVP acts automatically (see OVP values corresponding table).

Operating in the sense mode requires that the maximum output voltage will not be exceeded. Maximum 2V per load lead can be compensated. The voltage drop in the load lines decreases the maximum output voltage rating. Example of a 30V unit: if the total voltage drop in the load leads is 2V you must subtract this value from the maximum programmable output voltage 30V – 2V = 28V maximum available voltage at the load.

The sense terminals are directly connected to the power outputs.



Lokal Sensing
(factory setup)



Remote Sensing
(twisted sense lines)

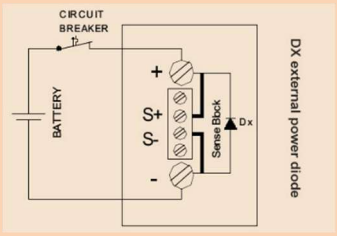
WARNING! PROTECT TO MIX UP SENSE CONNECTIONS. THIS COULD CAUSE SERIOUS DAMAGE TO THE DEVICE.

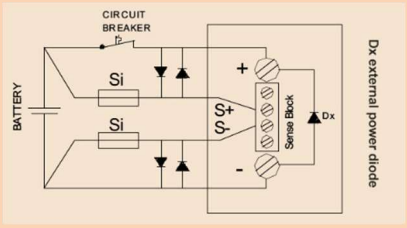
(Subject to alterations. This product is not designed to be used in applications such as life support systems wherein a failure or malfunction could result in injury or death)

Compensation of Load Line Drop Voltage (Sense ++/--) battery charger operation mode

Remote Sensing as a battery charger

If the CPS-EP power supply unit is used as a battery charger, it is recommended to refrain from sensing. It can lead to severe damage to the power supply, if the polarity of the sense line is confused (field experience: such error often occurs when system service is required, e.g., when the batteries are changed). If it is necessary to use sensing, proceed as described in the figure below. Proven approaches are 250mA for the fuses and 3...5A load capacity of diodes.





Current Distribution in Parallel Mode (CS), CSB Current Share Bus

To increase the output current, up to 5 units of the same model and output voltage can be operated in parallel. The operator shall ensure that the output voltage of each involved unit shall be set to the same value and with a maximum tolerance of ±0,5%. Derate the total output current by 5% to prevent the unit from overload operation. In parallel operation, a uniform current distribution between the participating power supplies is important. To prevent one of the power supplies going early into the current limitation and display error message. An uneven load and thus premature aging of the participating devices is prevented. (further information on page 12)
Connect CON3 contact 5 (CS) to contact 13 of the next device. Are other devices involved in the parallel operation, you may grind the CS bus through from unit to unit. The current division between the devices will be performed automatically. The accuracy of the current distribution is ±5% at $I_{out} \geq 0{,}5x\ I_{out}$ max.
Set the DIP switch S11 to the OFF position if you like to apply CS-mode operation. The factory set of the DIP switch S11 is ON (no CS operation).

External Shutdown (SD)

The power supply is set to the Shutdown mode, when the control input is either shorted via a relay contact, a switch contact or an NPN transistor with open collector (voltage drop <1V, current typ. 1,5mA). Alternatively, a voltage of 10 to 30V (typ. 12V/1.5mA, 24V/5.5mA) can be applied.

If the shutdown repeals the power supply starts with a delay of 35ms.

Using the softstart the current and the voltage rises within 100ms continuously to the default set values. Between control input SD, power input, and power output is a reinforced Isolation of max. 400Vdc and a basic isolation of max. 600Vdc working voltage.

Set Voltage Range via Potentiometer (Uadj)

The power supply is equipped with 1 potentiometer Uadj for setting the voltage. The current limiting is fix.

Continuous Mode Operation Device

The device provides continuous current while overloaded and the voltage goes down.

(Subject to alterations. This product is not designed to be used in applications such as life support systems wherein a failure or malfunction could result in injury or death)

Over Load Behaviour

The CPS-EP changes from the standard operation mode into the high current mode when high and quick overload occurs. Thus, it provokes a restart after a 30ms break and delivers continuous current to the output. This special behaviour is a protection for the power supply and for the connected load.

Inhibit / Interlock (INH)

The power supply is equipped with a control input Inhibit (INH) to interlock a DC-shutdown of the power supply.

For the nominal operation of the power supply the connections of the control input "INH" must always be short-circuited.
The power output is switched off as soon as the connection between the contacts of the control input INH is interrupted.
If Inhibit is repealed, the power supply starts with a delay of 35ms. Using the softstart the current and the voltage rises within 100ms continuously to the default set values. Between the INH contacts applies a current of typical 2mA.

! Warning against damage in case of incorrect connection assignment

Never apply any external voltage to the control input INH. Never connect a resistor to the INH interface. The INH can only be connected to a floating contact (e.g., mechanical switch or relay). Between control input INH and power output is a reinforced Isolation of max. 400Vdc and a basic isolation of max. 600Vdc working voltage.

DC-OK Relay (DC Power Good)

The signal DC OK has potential-free relay contacts (changeover). The contacts of CON1 Pin2 and CON1 Pin4 are closed (relay coil is energized) when the power operates as a connstant voltage source. The contacts CON1 Pin2 and CON1 Pin4 are open when the power output is inhibited by SD, INH, OT, FF, OVP, OCP or a defective PFC. Contact load (resistive load): 30Vdc/1A, 60Vdc/0.3A, 30Vac/0.5A. Betwenn the intermediate relay contact and the power output is a reinforced Isolation of max. 400Vdc and a basic isolation of max. 600Vdc working voltage.

AC-OK Relay (AC Power Good)

The Power Good relay reports whether the input voltage is too low or missing. The notification signal AC OK is generated with potential-free relay contacts (changeover).
The contacts of CON1 Pin1 and CON1 Pin3 are closed (relay coil is energized) when the input voltage is higher than typ. 175Vac or 210Vdc (switch-on). The contacts of CON1 Pin5 and CON1 Pin3 are closed (relay coil is not energized) when the input voltage is lower than typical 165Vac or 145Vdc (turn-off). Contact load (resistive load): 30Vdc/1A, 60Vdc/0.3A, 30Vac/0.5A.
Between the relay contacts and the power output is a reinforced isolation of max. 400Vdc and a basic isolation of max. 600Vdc working voltage.

Over Voltage Protection Signaling (OVP)

If an over-voltage occurs to the output (for example, defective components, external feed voltage), it is followed by the shutdown of the power output. A periodic restart attempts (ticker operation period 1s). The LED OVP lights red.

Over Temperature Shutdown (OT)

The alarm signal OT is high when the temperature of the power supply is higher than the over-temperature protection threshold. Output Open Collector I_{MAX}=10mA, V_{LOW}≤0,6V, V_{MAX}=30V.

(Subject to alterations. This product is not designed to be used in applications such as life support systems wherein a failure or malfunction could result in injury or death)

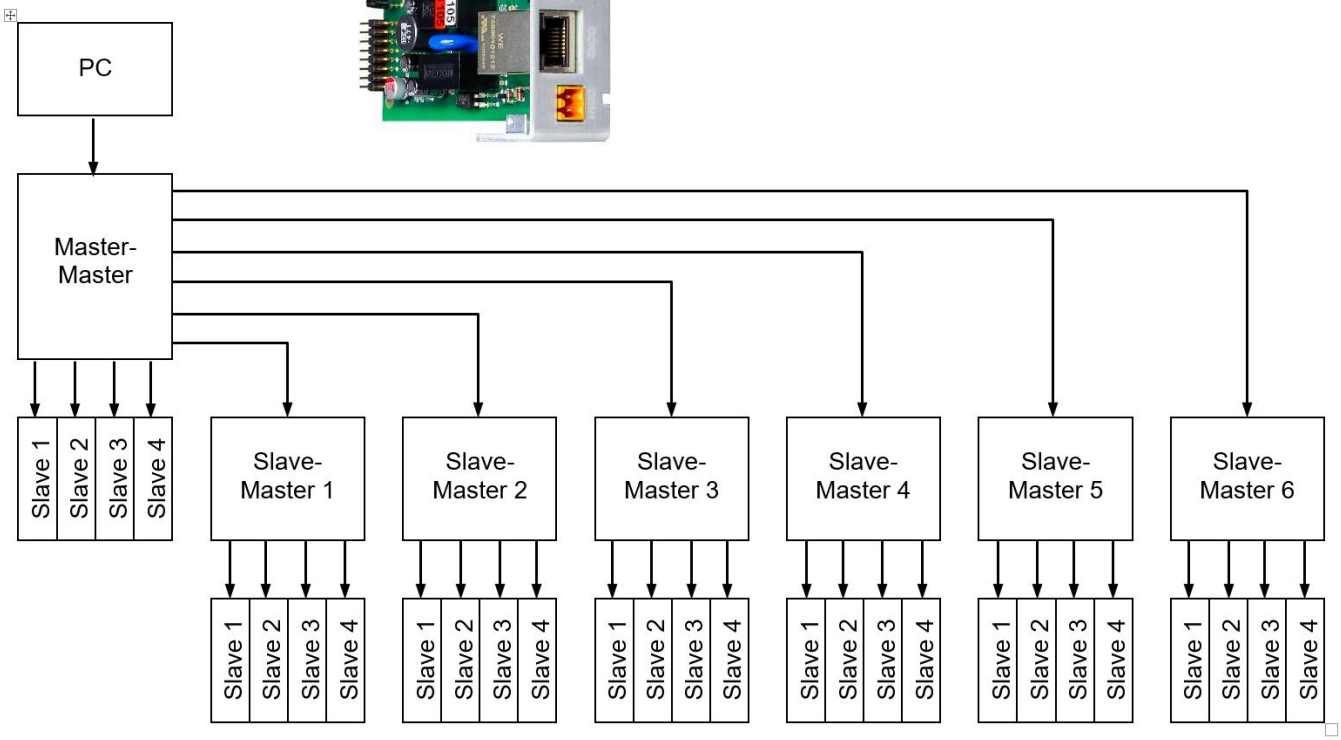
Fan Fail Signal (FF)

The power supply fans are continuously monitored. FF occurs when one or both fans have an error (lower speed due to bearing contamination, blockage, or failures). A failure message is sent: The status signal FF applies high. Output Open Collector I_{MAX}=10mA, V_{LOW}≤0,6V, V_{MAX}=30V.

LAN Interface DIGI3201 12 Bit (option)

The power supply can be operated via the DIGI3201 LAN interface. The interface can be easily configured using a standard WEB browser. It is therefore compatible with Windows-based software such as WinLab, LabView and others. The digital interface makes it possible to set up DC networks consisting of a master-master, slave-masters, and slaves power supply units. The LAN interfaces are networked via an external standard Ethernet switch (not included). All functions of the analogue interface are also available with the DIGI3201 interface. The DIGI3201 interface recognises the power supply unit itself and automatically calibrates itself to the device. We have found that most defects in a system power supply occur at the interface - whether due to overvoltage or defects in the control unit. When developing the interface, we therefore opted for a design-to-service approach. It is much cheaper to keep a new interface in stock as a spare part than a complete power supply. System downtimes are also reduced in the long term. Even less well-trained specialist personnel can replace the DIGI3201 or the analogue interface on site.

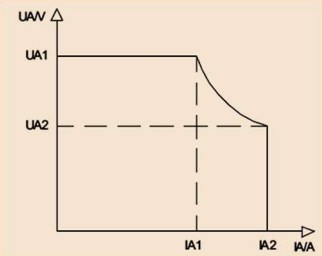
Configuration with optional LAN interface



(Subject to alterations. This product is not designed to be used in applications such as life support systems wherein a failure or malfunction could result in injury or death)

C/V Chart and Operating Point

The output voltage set Vout is set with the potentiometer at the rear oft he power supply.
The current limit is fix.
The system integrator must make sure that the nominal output power does not exceed below values to protect the unit from operating under overload conditions. (also see OT thermal SD)

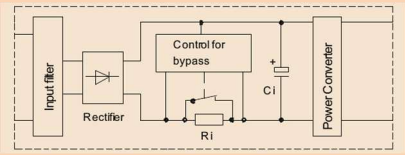


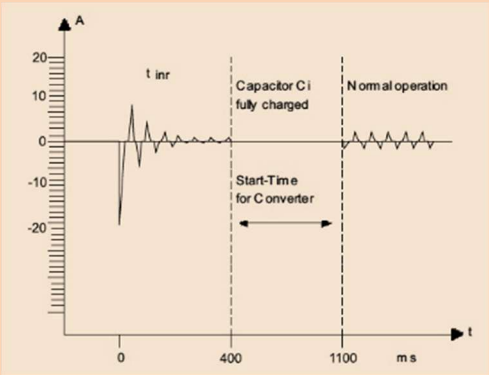
Model	Value UA1 (V)	Value IA1 (A)	Value UA2 (V)	Value IA2 (A)	Pmax (IA1/IA2)
CPS-EP2000.024	30Vdc	66,7A	24Vdc	84A	2001/2016W
CPS-EP2000.036	45Vdc	44,4A	36Vdc	56A	1998/2016W
CPS-EP2000.048	58Vdc	34,5A	48Vdc	42A	2001/2016W
CPS-EP2000.072	90Vdc	22,2A	72Vdc	28A	1998/2016W
CPS-EP2000.110	150Vdc	13,3A	110Vdc	18,2A	1995/2002W

Inrush Current Limiter (electronic)

The power supply unit has an electronic current limiter (230Vac=14,6A_{rms}/20,7A_{peak}).

It is a precisely working circuit instead of a usual simple NTC solution. The accuracy is ±10%, regardless of the operating temperature and the duty cycles (interval ≥10s). We recommend the smallest circuit breaker a characteristic B with 16A.





Temperature Monitoring & Derating

The maximum ambient temperature during operation is + 60°C. If the overtemperature protection is activated, the power supply but not the fan is switched off.

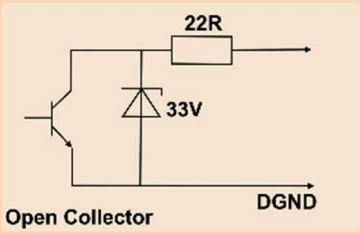
The measuring point is 50mm outside the power supply at the front side (fan/blower input). The power supply unit starts automatically when it has cooled down.

(Subject to alterations. This product is not designed to be used in applications such as life support systems wherein a failure or malfunction could result in injury or death)

Open Collector Circuit Interface

Between all open collector outputs and the power output is a reinforced Insulation of max. 400Vdc and a basic isolation of max. 600Vdc working voltage.

(Note: this applies to all signals from CON1 and CON2, regardless of whether they are designed as open collector, or not)

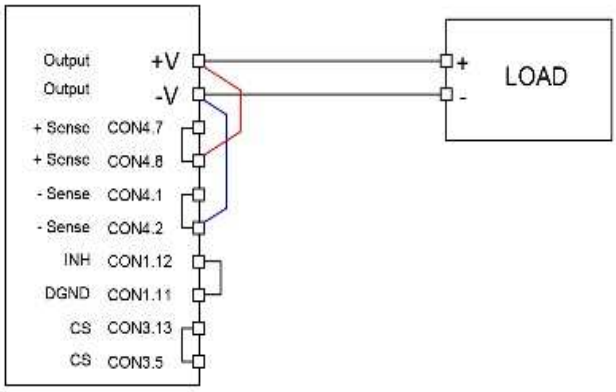


Series Operation

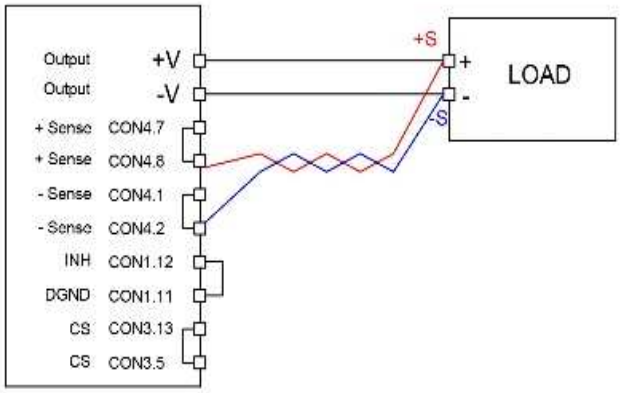
Two or more units of the same model and output voltage can be operated up to a total voltage of 600Vdc in series (not applicable to EN62368-1). Due to the dielectric strength of the internal components used, only the models with an output voltage of 48Vdc and later are approved for series operation. Other power supplies are not approved for series operation above 60Vdc.

Parallel Operation & N+1 Decoupling

To increase the overall power of the power supply, two or more devices of the same model with the same output voltage may be operated in parallel. When using the Current Share Bus, the number of devices is limited to 7 pcs. For performance applications with more than 7 devices that use the Current Share Bus, we recommend contacting our support team. For applications without the Current Share Bus, more than 7 devices can be operated in parallel. For power applications with a high dynamic range above 10kW, we recommend contacting our support team. We recommend using a busbar for the DC power connector. Make sure that the cable lengths and cable cross-sections of all power supplies to the busbar or to the star point are identical. Allow proper connection for low contact resistance. If you want to use the sensing function, connect it also to the star point or busbar. To avoid measurement errors, select the line length from the neutral point or from the busbar to the load as short as possible and use the maximum possible conductor cross-section.
The CPS-EP models have no internal O-ring diode, to operate the devices N+1 redundant.

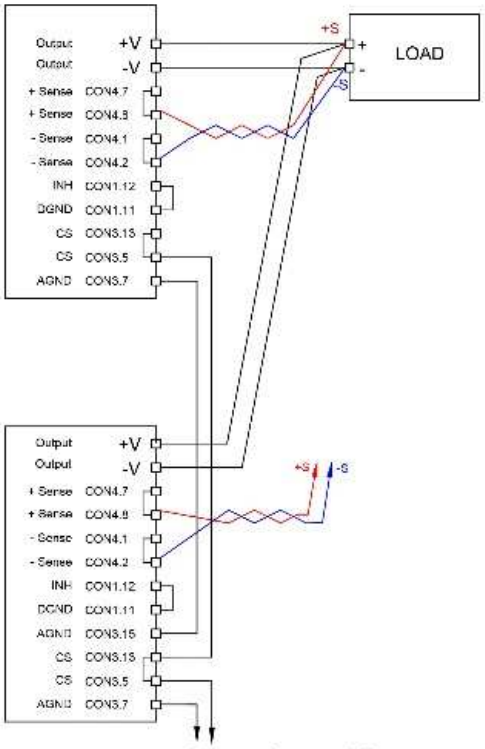


Configuration Standard Sense Mode

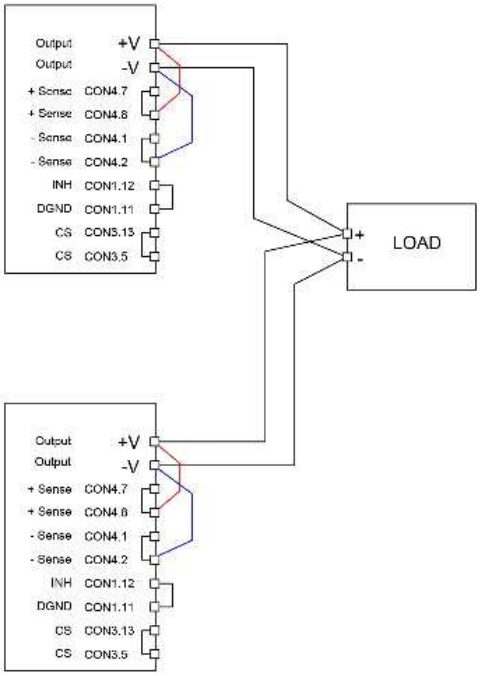


Configuration Remote Sense Mode

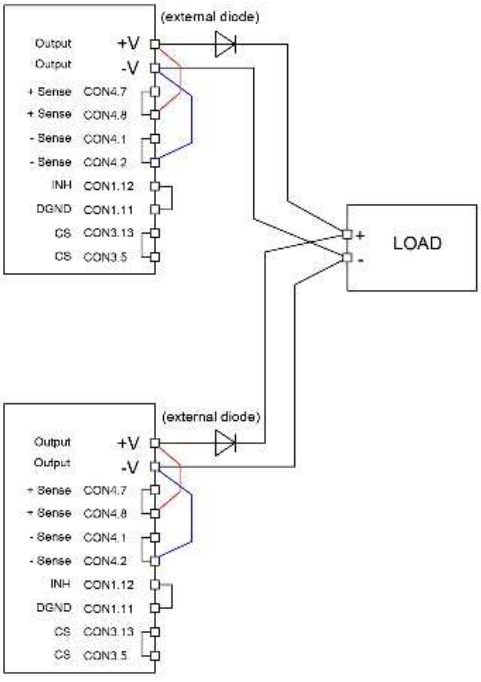
(Subject to alterations. This product is not designed to be used in applications such as life support systems wherein a failure or malfunction could result in injury or death)



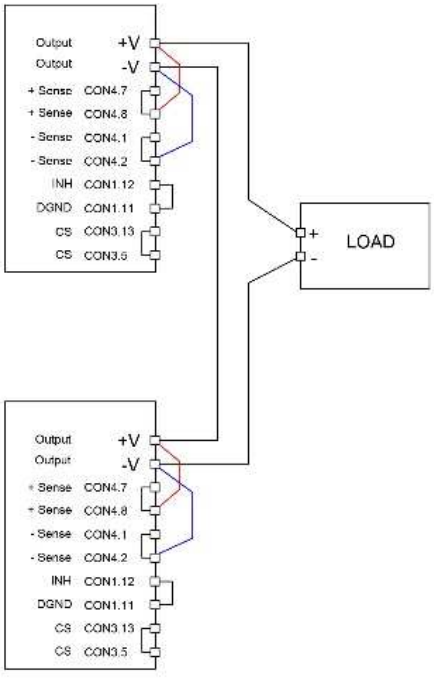
Parallel Current Share (CS)



Parallel Mode (No CS, Local Sense)



Parallel Decoupled Mode (No CS, Local Sense)



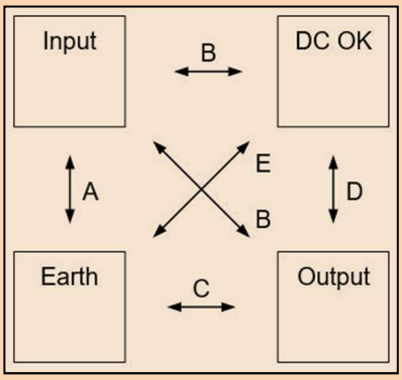
Serie Mode (No CS, Local Sense)

(Subject to alterations. This product is not designed to be used in applications such as life support systems wherein a failure or malfunction could result in injury or death)

Electrical Safety (Factory-Test / Field-Test Owner)

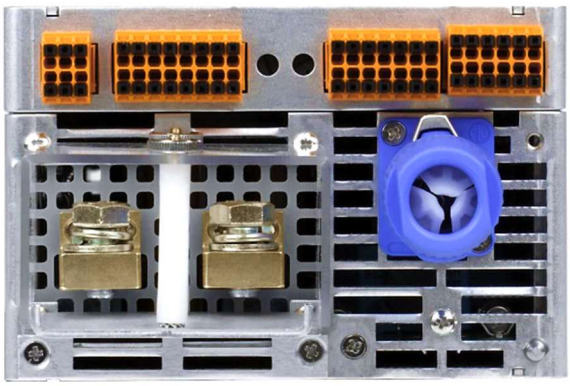
	T	A	B	C [1]	D	E
Type Test	60s	2500Vac	3000Vac	500Vdc	3000Vac	500Vdc
Factory Test	5s	2000Vac	2000Vac	500Vdc	1000Vdc	500Vdc
Field Test	2s	2000Vac	2000Vac	500Vdc	1000Vdc	500Vdc
Cut-Off current setting		>25mA	>25mA	>1mA	>1mA	>1mA

[1]) ≥48Vdc= 2800Vdc



Type and factory test are the manufacturer. While repating damage can happen to the power supply unit. For the field test (owner) follow the below instruction:

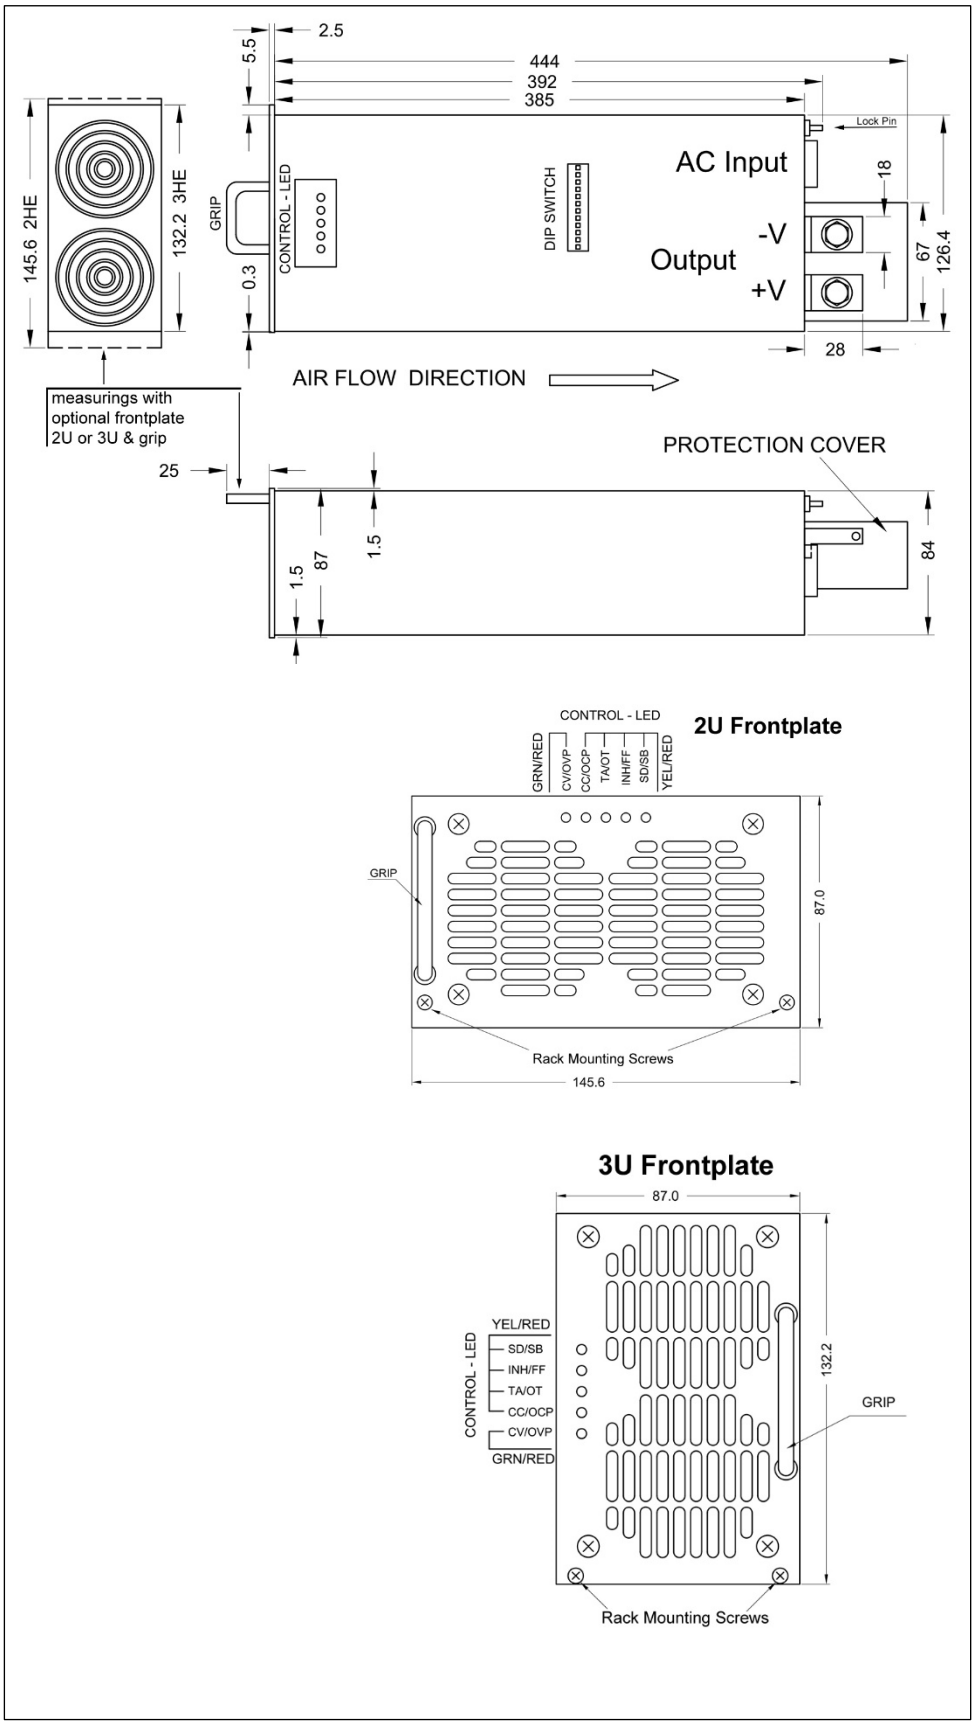
a) Use suitable test equipment, raising the voltage slowly.
b) Short circuit L1 and N, and all the DC output terminals.
c) Use only test voltages of 50/60Hz. The outputs are unearthed and therefore they have no resistance to GND/PE.
d) If the residual voltage is ≥60Vdc, observe the safety standards. Use only specially insulated screwdriver to trim the Ua/Ia.



ANALOGUE INTERFACE

DIGI3201 INTERFACE

(Subject to alterations. This product is not designed to be used in applications such as life support systems wherein a failure or malfunction could result in injury or death)



Mechanics

Aluminium-housing IP20.

Cooling is achieved via front-to-rear fans.

To ensure adequate heat dissipation, 50mm to the front and 150mm blockade-free distance from the device back wall must be guaranteed.

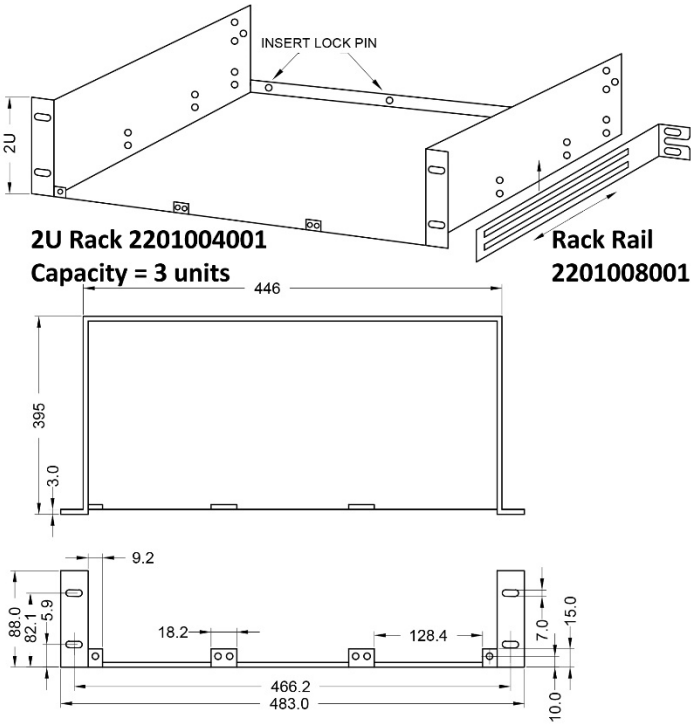
The harnesses are to be designed and installed to that the air outlet of the unit is not being blocked.

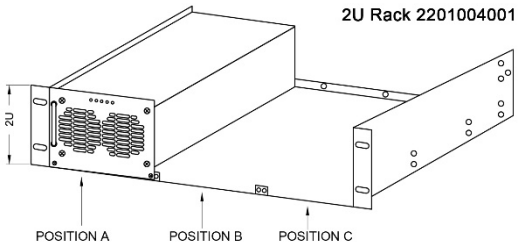
In a rack mounting of multiple subracks, the rear distance of the cable-management increases, depending on the type of the air duct.
An optional cable-accession assistance for the racks will be available soon.

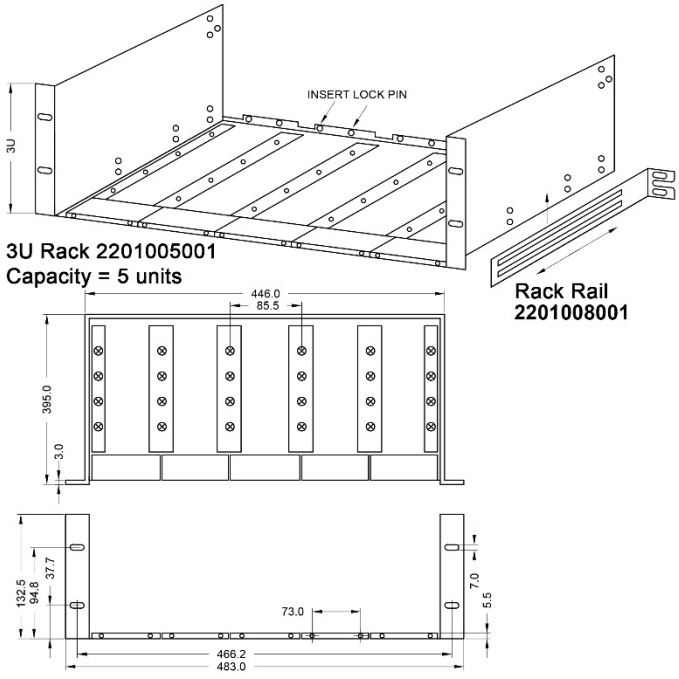
(Subject to alterations. This product is not designed to be used in applications such as life support systems wherein a failure or malfunction could result in injury or death)

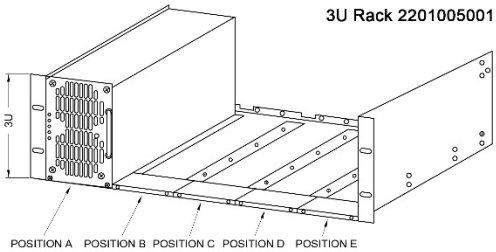
19“Subrack 2U & 3U

2U Subrack for 1-3 CPS-EP2000 with up to 6kW continuous power
3U Subrack for 1-5 CPS-EP2000 with up to 10kW continuous power









(Subject to alterations. This product is not designed to be used in applications such as life support systems wherein a failure or malfunction could result in injury or death)

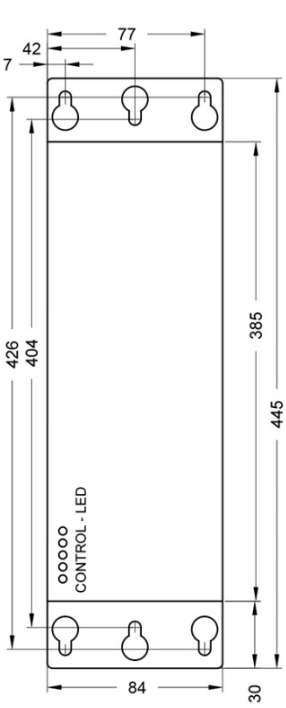
Wall Mount Option & 3D Heat Dissipation (3D-HD)

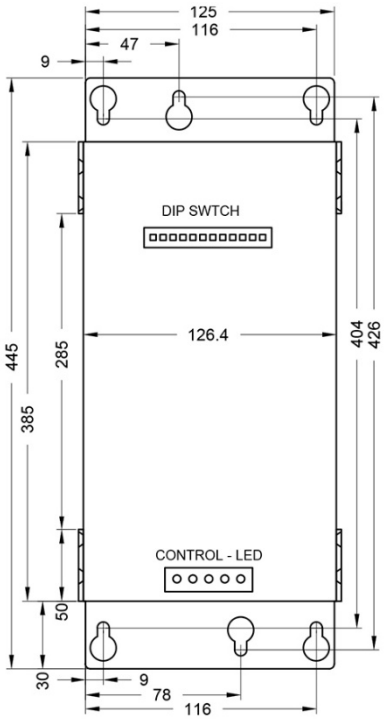
Our aligned and controlled heat dissipation design opens possibilities that are formerly being reserved to custom design power supplies: Steplessly hard mount of the CPS-EP2000/3000 power supply modules in a 3D-room.

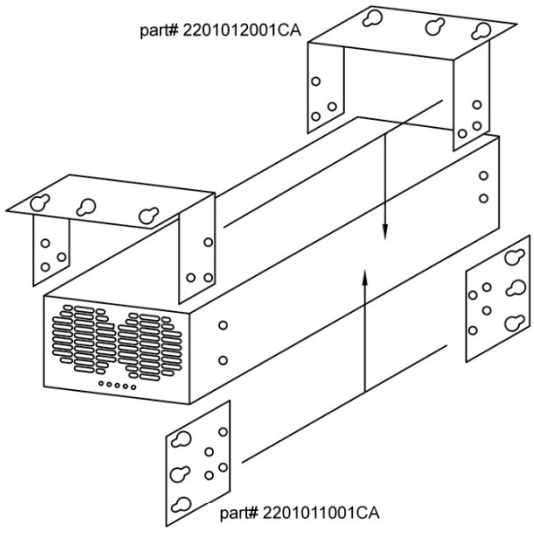
In practice that means that one can mount the modules into every angle imaginable. Our **3D H**eat **D**issipation (**3D-HD**) ensures optimal cooling in each mounting position you may consider.

All you may consider is to make sure, that at least a distance of 5cm (2 Inch) to the front cooling slots and 15cm (6 Inch) to the rear cooling openings are guaranteed to prevent from blocking the airflow. The cabling must also not block the heat dissipation.

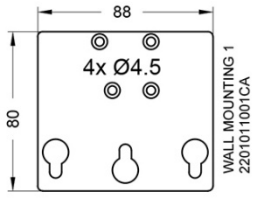
When the CPS-EP2000/3000 is hard mounted the optional front plates cannot be used. The standard control LEDs allow visualization from any mounting position (see below drawing).



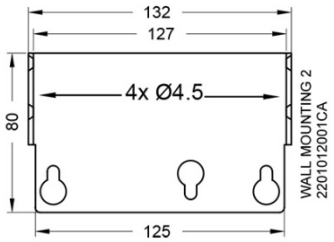




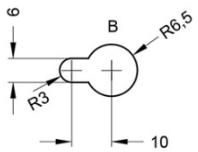
WARINING:
Only use the M4x10mm countersunk screws inluded into the mounting kit to prevent damage to the power supply unit.



Strait Hardmount



Flat Hardmount



(Subject to alterations. This product is not designed to be used in applications such as life support systems wherein a failure or malfunction could result in injury or death)

Available Options

Digital LAN Interface DIGI3201 12 Bit, 12 Bit (isolation 300/600Vdc)

The power supply can be operated via the DIGI3201 LAN interface. The interface can be easily configured using a standard WEB browser. It is therefore compatible with Windows-based software such as WinLab, LabView and others. For further information download DIGI3201 Manual. The interface has a reinforced isolation of max. 300Vdc and basic insulation of max. 600Vdc working voltage.

Test Certificate and Calibration

Optionally we offer with the delivery of a CPS power supply a Manufacturer's Inspection Certificate of electrical setpoint / actual values. The power supply then is "calibrated". Such Manufacturers Calibration Certificate for each power supply can uniquely be assigned via the device serial number.
A manufacturer calibration of a CPS-i can frequently be done via controlled recirculation on a regular basis. Please request the help of your local CPS dealer or contact us directly: service@camtec-gmbh.com

Made in Black Forest

CAMTEC POWER SUPPLIES

CPS-EP2000(R2) MANUAL

Safety regulations: Please read these instructions completely before using the equipment. Keep these instructions on to hand. The device may only be operated by trained specialist staff.

Installation:

1) The device is designed for devices and systems that meet the standard requirements for hazardous voltages, power, and fire prevention.
2.) Installation and service only by trained specialists. The AC power must be switched off. The work is to be labelled; accidental reconnection of the system must be prevented.
3.) Opening the device, its modification, loosening bolts, or operation outside the specified herein specification or in an unsuitable environment, has the immediate loss of warranty to follow. We disclaim any responsibility for any resulting damage to persons or things.
4.) Note: The device must not be operated without an upstream circuit breaker (CB). We recommend the use of B-Type 16A. It is prohibited to use the unit without PE. It may be necessary upstream device has a power switch.

Warning:

Non-compliance these warnings can result in fire and serious injury or death.

1. Never operate device without PE connection.
2. Before connecting the device to the AC network, make wires free of voltage and ensure that it cannot accidentally switch on.
3. Allow neat and professional cabling.
4. Never open nor try to repair the unit. Inside are dangerous voltages that can cause electrical shock hazard.
5. Avoid metal pieces or other conductive material to fall into the item.
6. Do not operate the device in damp or wet conditions.
7. Do not operate the unit under EX-conditions.

All parameters after 15 minutes of continuous operation at full load / 25°C / 230Vac 50/60Hz, unless otherwise indicated.

(Subject to alterations. This product is not designed to be used in applications such as life support systems wherein a failure or malfunction could result in injury or death)
